Tropical cyclone frequency

'Low' refers to less than one cyclone every three years per 0.002 dd^2, 'moderate' between one every three years to one every year per 0.002 dd^2 and 'high' to one to three cyclones per year per 0.002 dd^2. The unit '0.002 square decimal degree (dd^2)' is equivalent to 25 km^2 on the equator, diminishing as latitude gets higher.

** average based on eight years only.*
